Question 1

A pipeline uses Python for raw, bronze, and silver layers, SQL for gold, and a streaming source. When migrating it to Delta Live Tables or Lakeflow Spark Declarative Pipelines, which change is required?

A. The pipeline must be written entirely in Python.

B. The pipeline must stop using a medallion-based architecture.

C. The pipeline must be written entirely in SQL.

D. The pipeline must replace the streaming source with a batch source.

Original question

Question 2

When should a data engineer use MERGE INTO instead of INSERT INTO?

A. When the location of the data needs to be changed

B. When the target table is an external table

C. When the source is not a Delta table

D. When the target table cannot contain duplicate records

Original question

Question 3

A data entity must combine data from multiple tables, be available to other engineers in other sessions, and be saved at a physical location. Which entity should be created?

A. Database

B. Function

C. View

D. Temporary view

E. Table

Original question

Question 4

A data organization leader is concerned because the reports generated by the data analysis team are inconsistent with those produced by the data engineering team. The leader suspects that the root cause of this problem lies in the siloed nature of their existing data engineering and data analysis infrastructures. How could implementing a data lakehouse architecture help resolve these discrepancies?

A. Both teams would autoscale their work as data size evolves

B. Both teams would use the same source of truth for their work

C. Both teams would reorganize to report to the same department

D. Both teams would be able to collaborate on projects in real-time

E. Both teams would respond more quickly to ad-hoc requests

Original question

Question 5

Which of the following best illustrates a situation where employing cluster pools would be advantageous for a data team? Keep in mind that cluster pools aid in minimizing cluster startup time by pre-allocating resources and ensuring that instances are ready and available as soon as they are required.

A. An automated report needs to be refreshed as quickly as possible.

B. An automated report needs to be made reproducible.

C. An automated report needs to be tested to identify errors.

D. An automated report needs to be version-controlled across multiple collaborators.

E. An automated report needs to be runnable by all stakeholders.

Original question

Question 6

In the classic Databricks architecture, the control plane is responsible for managing and orchestrating various components and services of the Databricks platform, separate from the data plane where the actual data processing occurs. Which of the following components is entirely hosted within the control plane?

A. Worker node

B. JDBC data source

C. Databricks web application

D. Databricks Filesystem

E. Driver node

Original question

Question 7

As part of understanding the advantages of using the Databricks Lakehouse Platform, it's important to identify specific benefits offered by Delta Lake. Delta Lake, as an integral component, brings additional capabilities to the platform. Which of the following benefits is specifically provided by Delta Lake?

A. The ability to manipulate the same data using a variety of languages

B. The ability to collaborate in real time on a single notebook

C. The ability to set up alerts for query failures

D. The ability to support batch and streaming workloads

E. The ability to distribute complex data operations

Original question

Question 8

To ensure optimal performance and management of large-scale data, it's crucial to understand how Delta tables are structured and organized. Given this, which of the following describes the storage organization of a Delta table?

A. Delta tables are stored in a single file that contains data, history, metadata, and other attributes.

B. Delta tables store their data in a single file and all metadata in a collection of files in a separate location.

C. Delta tables are stored in a collection of files that contain data, history, metadata, and other attributes.

D. Delta tables are stored in a collection of files that contain only the data stored within the table.

E. Delta tables are stored in a single file that contains only the data stored within the table.

Original question

Question 9

As a data engineer, you often need to manipulate and update data within Delta tables. Consider a scenario where you have a Delta table named my_table, which includes a column named age. Your task is to remove all rows from this table where the value in the age column is greater than 25. Which of the following code blocks will perform this operation and save the updated data back to the same Delta table?

A. SELECT * FROM my_table WHERE age > 25;

B. UPDATE my_table WHERE age > 25;

C. DELETE FROM my_table WHERE age > 25;

D. UPDATE my_table WHERE age <= 25;

E. DELETE FROM my_table WHERE age <= 25;

Original question

Question 10

A data engineer identified an error during a routine daily update to a Delta table. To correct this, they intend to use Delta Lake's time travel feature to revert the table to its state from three days ago. Unfortunately, the data engineer encounters an issue: the time travel attempt fails because the data files necessary for the restoration have been deleted. Which of the following explains why the data files are no longer available?

A. The VACUUM command was run on the table

B. The TIME TRAVEL command was run on the table

C. The DELETE HISTORY command was run on the table

D. The OPTIMIZE command was run on the table

E. The HISTORY command was run on the table

Original question

Question 11

In the context of modern data architectures, consider the data lakehouse paradigm, which combines the benefits of data lakes and data warehouses. Discuss which specific features of a data lakehouse architecture contribute to enhanced data quality compared to a traditional data lake.

A. A data lakehouse provides storage solutions for structured and unstructured data.

B. A data lakehouse supports ACID-compliant transactions.

C. A data lakehouse allows the use of SQL queries to examine data.

D. A data lakehouse stores data in open formats.

E. A data lakehouse enables machine learning and artificial Intelligence workloads.

Original question

Question 12

In the context of managing and versioning projects within the Databricks environment, data engineers have the option to either utilize the built-in Databricks Notebooks versioning feature or to version their projects using Databricks Repos. Considering these two approaches, which of the following represents a key advantage of employing Databricks Repos over the native Databricks Notebooks versioning system?

A. Databricks Repos automatically saves development progress

B. Databricks Repos supports the use of multiple branches

C. Databricks Repos allows users to revert to previous versions of a notebook

D. Databricks Repos provides the ability to comment on specific changes

Original question
